Global Toolbar

Draw Click Area

In order to match the expectations of other design tools it is important to be able to see where a signal is triggered from. In practice this is a button on a UI screen. Due to the nature of componetisation in design studio it is not assumed a button will be either A) a top level item of a ui file (it may be nested many components deep) or B) All button signals will lead to a direct UI change, (it may well be a button sends a signal to the backend and the backend sends another signal to the UI.)

In essence this means we need to collect all possible signals from the screen and it may not be that signals have any visual representation in the screen that we can automatically highlight . We can however offer a way to draw this highlight and connect it to a user interaction on the screen, simulating the effect of having the flow starting from a highlighted part of the UI.

🗩 Zoom In

Pretty obvious, zoom in to the flow scene. If the tool is selected, holding the command / alt key should flip the tool from zoom in to zoom out. Also zoom can remain with a shortcut on the mouse wheel + alt / command keys.

Connect Pretty obvious, zoom in to the flow scene. If the tool is selected, holding the command / alt key should flip the tool from zoom in to zoom out. Also zoom can remain with a shortcut on the mouse wheel + alt / command keys.

D Zoom Out

Pretty obvious, zoom out from the flow scene. If the tool is selected, holding the command / alt key should flip the tool from zoom out to zoom in. Also zoom can remain with a shortcut on the mouse wheel + alt / command keys.

Starting Point

A Flag that sets where a flow starts from, by default the first screen you add is the default starting point. Can be moved via the context toolbar, context menu (right click) on the screen in the flow or also maybe by dragging the start node in the flow view itself.

Clicking this icon should frame the whole flow graph within the UI view. (note: it's not really a tool as such, just an icon that performs an action)

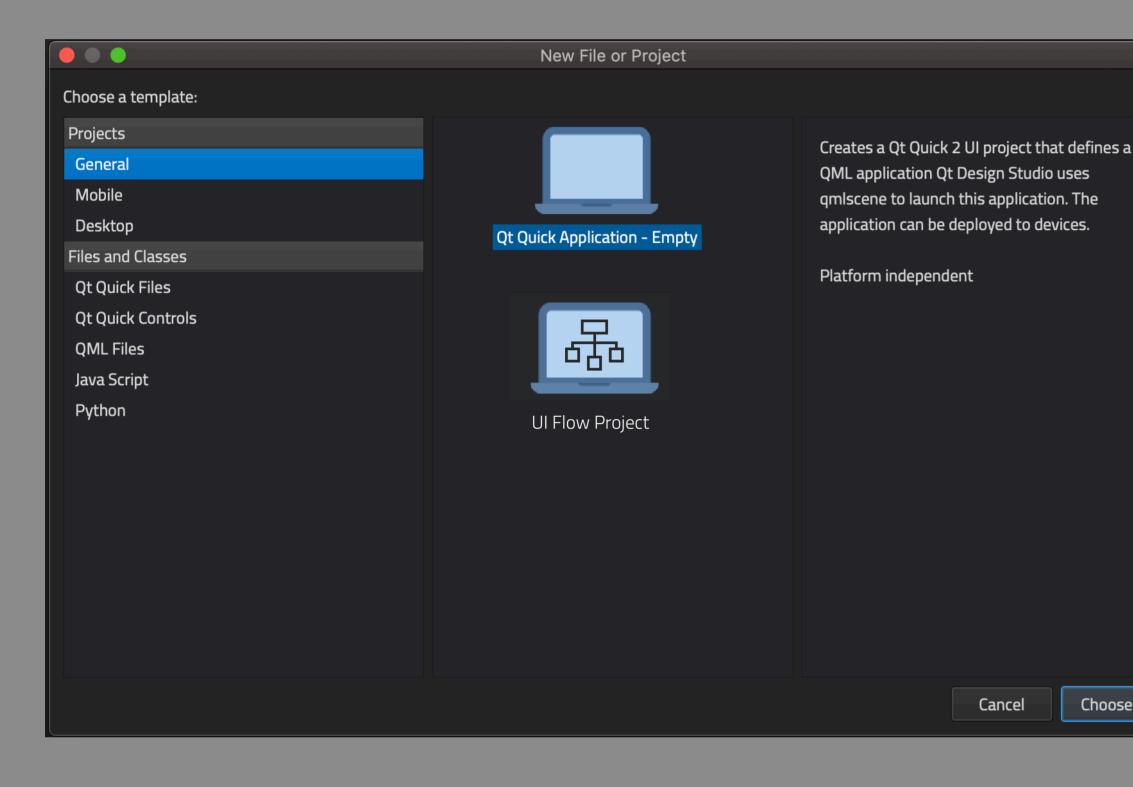

Annotate

You can add annotations to each element in the flow graph, both the flowScreens andFlowTransitions. Annotations can be added via the property editor, context menu (right click on the element) or using the tool in the context toolbar.

((M Broadcast Node

You can add a special broadcast node when a screen can appear from any other screen. Works together with white and blacklists.

If a flow project is selected from the wizard then you automatically go into the flow mode. You need a flowScreen added by default and a way to add new screens from the flow mode interface.
